ABSTRACT

The projections presented in this document (mostly in the form of tables) are characterized by a number of features. For example, population predictions for three Chicago area ethnic groups, black, Spanish speaking, and majority white and other (including non-white population other than black) are provided separately. Another feature of these predictions is that they do more than just predict the number of persons (classified by age, sex, and race/ethnicity) that will be living in the Chicago region. The projections translate the "body count" for each year from 1975 to 2000 into: (1) number of households; (2) marital status; (3) labor force; (4) school enrollment by grade; and (5) classroom teachers. Each of these "functional" projections (except the last) is done separately for the black, Spanish, and majority white populations by age and sex, and then summed for grand totals of all race/ethnic groups combined. In addition, detailed cross-tabulations of the projections are included for individual researchers who wish to further explore particular problems. For some topics (especially labor force and school enrollment), these detailed statistics are provided for single years of age between 1978 and 1983, in order to show year-to-year changes in the immediate future. Acknowledgements

The authors would like to thank a number of persons for their help in the various stages of the preparation of this report. Useful suggestions were obtained from Marie Bousfield of the City of Chicago Planning Department, Max Dieber of the Northeastern Illinois Planning Commission, Richard Irwin and John Long of the Bureau of the Census, Martin Frankel of the National Center for Education Statistics, Donald Pittenger of the State of Washington Planning Office, and Teresa Sullivan of the University of Chicago. Valuable research assistance was performed by Tom Bonczar, Nguyen Buutap, Carrie Hinze, and Barbara Lee. The manuscript was edited by George Rumsey and prepared for publication by the members of the manuscript unit of the Community and Family Study Center: Eden Clorfene, Cheryl Crossgrove, Joe Glass, Caren Gotlieb, Robin Kahn, Dana Lucisano, Judy McCarthy, Jane Plihal, and Joyce Yoways.

Part I
SUMMARY

1
Overview

Many Chicagoans, who have long been accustomed to hearing only bad news when the subject of population is mentioned, will be pleasantly surprised at the implications of a new set of population projections that the Community and Family Study Center, the University of Chicago, has prepared. These projections take into account some very recent population developments not incorporated in previous forecasts. The Chicago metropolitan area will undergo some important changes in population characteristics in the next 25 years, despite the fact that its total population is not expected to change greatly. Especially significant is change in age-composition caused by the aging of the "baby boom" generation (born between 1945 and 1958) and the generations of children born during the phase of rapid fertility decline during the 20 years since. For the remainder of this century, most of the impact is favorable toward reducing poverty and unemployment, raising standards of living, continuing racial integration, and improving the quality of life.

Race/ethnic groupings. A unique feature of these projections is that they separately forecast the population of each of three race/ethnic groups:

(a) Black (Negro)
(b) Spanish language (persons living in households where Spanish is spoken)
(c) Majority White and other (including non-White population other than Negro).

(For convenience in reporting, these three groups will be identified as "Black," "Spanish," and "Majority White.") This report awards to the large and rapidly growing Spanish language population the place it rightfully deserves, after long being neglected by statisticians, demographers, and municipal administrators.

Functional projections. Another feature of these projections is that they do more than just predict the number of persons (classified by age, sex, and race/ethnicity) that will be living in the Chicago region. The projections translate this "body count" for each year from 1975 to 2000 into:

(a) number of households
(b) marital status
(c) labor force
(d) school enrollment, by grade
(e) classroom teachers.

Each of these "functional" projections (except the last) is done seperately for the Black, Spanish, and Majority White populations by age and sex, and then summed for grand totals of all race/ethnic groups combined.

Central city and suburbs. All forecasts are made separately for the Chicago central city and metropolitan "suburban ring" comprised of the portion of Cook County outside Chicago and the five additional metropolitan counties of Dupage, McHenry, Lake, Will, and Kane.

Method. The method of projection used is the "components" method, a standard procedure applied to the projection of national populations. Future trends are predicted separately for the three components of the population growth rate: birth rates, death rates, and migration balance (in-migration minus out-migration).

The baseline from which the projections are made is the 1970 census. All population estimates and special population reports issued by the U.S. Bureau of Census since 1970 have been incorporated. (The details of the procedure are described in a technical appendix.)

A summary of the statistics (omitting details of age-sex composition) is provided as follows:

Table 1. Future population of the standard metropolitan statistical area as a whole
Table 2. Future population of Chicago city
Table 3. Future population of the Chicago suburban ring.

For each of these tables, a supplementary table converts the population counts into percentages in order to facilitate an appreciation of the changes that will occur.

Tables 4 through 21 are detailed projections. The reader should consult the Table of Contents to identify particular subjects for which data are desired.

These forecasts are presented as a public service in the belief that detailed and careful population projections can benefit everyone by improving planning. More realistic plans can be made for commercial and industrial expansion, public education, urban renewal, and municipal and community services when the size and composition of the population to be served is appreciated. One of the new features of the present projections is the provision of data that can be used specifically for each of these areas of planning, rather than simple age-sex counts.

Demographers do not have an outstanding record for predicting the future exactly. Hence, these numbers should be used with allowance for projection error. Instead of presenting a "high," "medium," and "low" series, as is often done, this report offers a single "best estimate" in the light of the evidence now available of what seems to be the most likely demographic outcome in future years.

II
Major Findings

A. Total population of the metropolitan area

1. Today the Chicago SMSA (standard metropolitan statistical area) is estimated to contain slightly more than 7 million inhabitants; it is expected to gain almost one million inhabitants between 1978 and 2000 (see Table 1 and Figure 1). This number is considerably less than previous projections prepared by metropolitan planners, but higher than could have been predicted on the basis of the pessimistic outlook that developed during 1970-77 as unemployment soared and the migratory rush to the "Sun Belt" boomed. The sources of this expected growth are:

(a) a heavy in-migration of Spanish population
(b) continued natural increase (more births than deaths) of the resident population, primarily because of the younger age structure left over from the "baby boom."

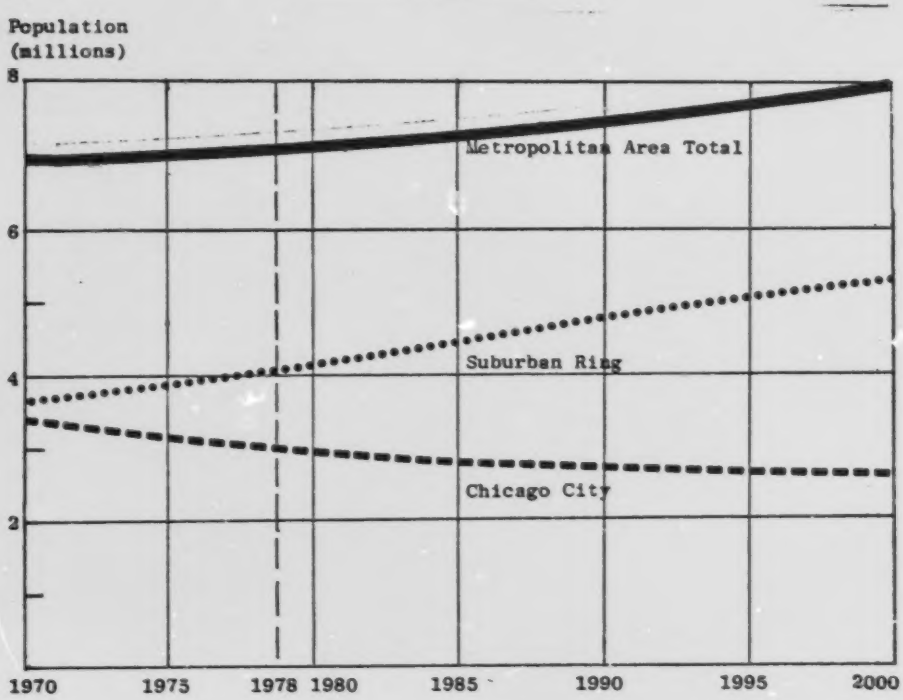

Figure 1. PROJECTED CHANGE IN TOTAL POPULATION OF THE CHICAGO SMSA, CHICAGO CITY, AND SUBURBAN RING, 1970-2000

All of this growth will take place in the suburban areas, as Chicago city will continue to deconcentrate and decongest (see next section).

2. Nearly 50 percent of this growth will be made by the Black population, whose rate of growth has rapidly decelerated in recent years. This deceleration has been caused by:

(a) a rapid decline in the birth of the Black population to a level approaching that of the White population

(b) a reversal of the traditional migration patterns such that, for the remainder of this century, the SMSA is expected to suffer a *net loss* of Blacks through migration.

3. More than 50 percent of this growth will be contributed by the Spanish population, which has been moving to the metropolitan area in very large numbers.

4. None of the growth will be created by the Majority White population, which is not expected to have enough natural increase (more births than deaths) to offset the expected continued out-migration.

5. These projections call for almost zero growth of the Majority White population, a 40 percent growth of the Black population, and an amazing 169 percent increase in the Spanish population during the 30 years 1970-2000. It is estimated that as of 1978 the SMSA contained about 450,000 Spanish inhabitants, and that by 2000 it will number about 840,000.

As a consequence of the explosive growth of the Spanish population, moderate growth of the Black population, and zero growth of the White population, the race/ethnicity composition of the SMSA as a whole is expected to change as follows:

Race/ethnicity	*1970*	*1978*	*2000*	*Change*
Total	100.0	100.0	100.0	--
Black	17.6	19.5	21.7	+4.1
Spanish	4.5	6.4	10.5	+6.0
Majority White	77.9	74.1	67.8	-10.1

B. Population of Chicago city

1. Chicago city is expected to lose another 171,000 inhabitants (it has already lost 400,000 in the 8 years since the 1970 census), to have a total population in the year 2000 slightly smaller than the estimated 2,692,000 residents on July 1, 1978 (see Table 2 and Figure 1). This anticipated change is based on the following trends:

(a) a predicted slacking of the flight of the Majority White population from the central city

(b) a predicted continuation of the rapid influx of the Spanish population to the central city

(c) a continued net migratory outflow of the Black population to the suburbs and to other regions of the nation.

These somewhat optimistic forecasts of Chicago city's future population size assumes that many of the current efforts to revitalize the inner city will be successful: employment will be available; schools will be improved; crime rates will be reduced; racially integrated residential areas will become more common; etc. It also anticipates a tendency for many suburbanites to return to the city as a result of the heightened costs (both in time and money) of commuting to Chicago via automobiles from distant suburbs.

2. The Black population of Chicago city will continue to grow, but more slowly than in the recent past. Meanwhile, the Spanish-speaking population in the city is expected to grow almost explosively (more than doubling before 2000). The net outflow of Majority White population from the city is expected to continue, but at substantially reduced rates in comparison with the huge exodus in the first five years of the 1970's, widely labeled as "White flight."

3. The expected change in racial/ethnic composition of Chicago city resulting from the above trends is as follows (see also Figure 2):

Race/ethnicity	*1970*	*1978*	*2000*	*Change*
Total	100.0	100.0	100.0	—
Black	32.7	40.0	46.7	+14.0
Spanish	7.0	11.0	18.9	+11.9
Majority White	60.3	49.0	34.4	-25.9

At the present time, for each 10 residents of the city, 4 are Black, 1 is Spanish, and 5 are Majority White. By 2000 this is expected to approach 5 Black, 2 Spanish, and 3 Majority White. Figure 2 graphs the expected change in race/ethnic composition of Chicago city.

Already, in 1978, the Majority White population constitutes less than one-half of the city's population.

C. Population of the suburban ring

The suburban ring (SMSA outside Chicago city) contains slightly more than 4 million persons as of 1978. This represents an increase of more than 400,000 persons in 8 years, or about 50,000 per year. The projections anticipate that roughly this amount of additional population will arrive in the suburbs each year for the remainder of the century.

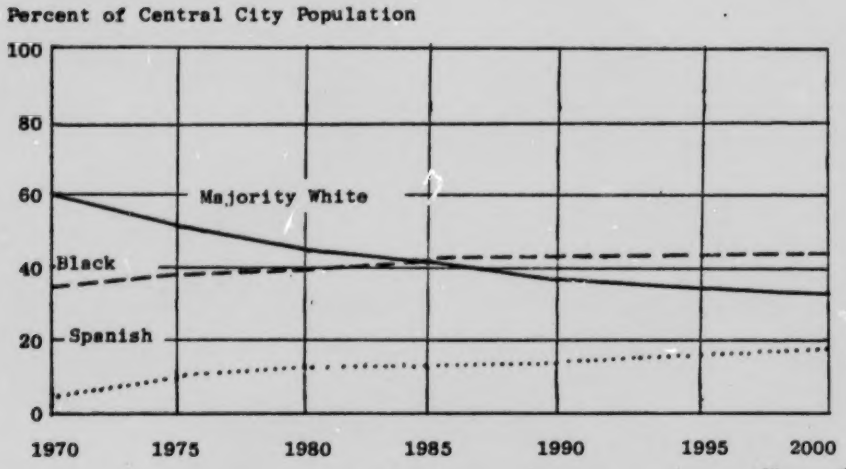

Figure 2. CENTRAL CITY POPULATION: PERCENT IN EACH RACE/ETHNIC GROUP, 1970-2000

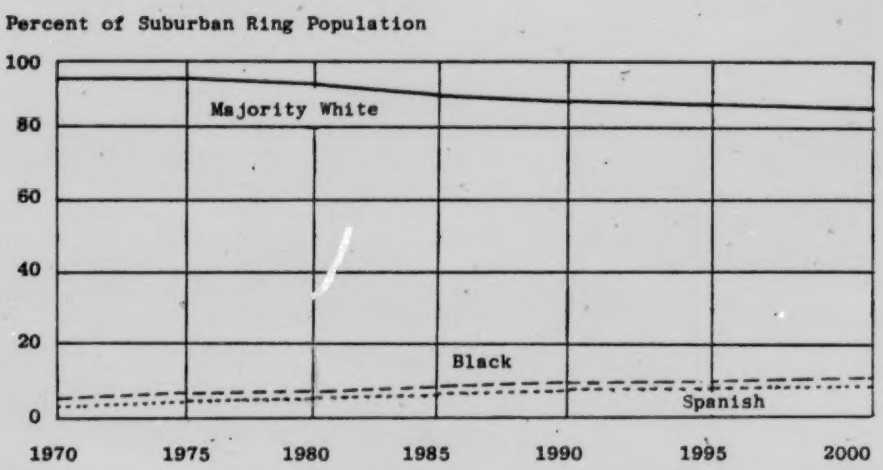

Figure 3. SUBURBAN RING POPULATION: PERCENT IN EACH RACE/ETHNIC GROUP, 1970-2000

As a result, the year 2000 will find about 5.2 million persons in the suburbs (assuming no change in city boundaries). (See Table 3 and Figure 1.)

This suburban growth is not simply an extrapolation of past trends, however.

(a) It assumes some acceleration in the suburbanization of the Black population.

(b) It assumes that the Spanish population will diffuse rather rapidly and easily into the suburbs as its economic status improves.

(c) It assumes a substantial diminution of the rate of "White flight" from Chicago city, and of the net loss of White residents to other SMSA's.

Underlying these assumptions is an anticipated moderation of race/ethnic residential segregation, with greater tendency for families to move in accordance with their income

and place-of-work needs, and less to avoid school desegregation and biracial/ethnic neighborhoods.

Despite the fact that the projections call for very rapid percent growth in the Black population (231 percent) and in the Spanish population (304 percent), and only slow growth for the Majority White population (30.4 percent), the total impact on the race/ethnic composition of the suburban ring will be only moderate. (The number of Black and Spanish population now in the suburbs is so small that doubling or trebling their numbers does not result in dramatic changes in their share of the total.) The projected race changes in ethnic composition of the suburbs are as follows (also see Figure 3):

Race/ethnicity	*1970*	*1978*	*2000*	*Change*
Total	100.0	100.0	100.0	--
Black	3.6	4.6	8.2	+4.6
Spanish	2.1	3.1	6.0	+3.9
Majority White	94.3	92.3	85.8	-8.5

An obvious consequence of this suburban growth (and central city decline) described above is that a progressively smaller percentage of the SMSA total population will live in the central city and a correspondingly increased proportion will live in the suburban ring. This change is illustrated in Figure 4, not only for the total population but for each of the three racial/ethnic groups.

D. Age composition: SMSA, city and suburbs

Throughout the remainder of this century both Chicago city and suburbs will enjoy a progressively more favorable age composition (see Tables 1, 2, 3 and Figure 5). The baby boom population, born between 1945 and 1958, are now aged 20-33 years of age. These are the prime ages for marriage, labor force participation, and childbearing. This cohort of people will gradually age, yet by the year 2000 will still be in the vigorous working years 42-55 years of age. Meanwhile, the proportion of young dependents, the population 0-14 years of age, which has been declining will steadily tend to level off or increase a little in the 1980's and 1990's. The older population (65 and over) will grow only moderately. Thus, the total "dependency load" (young and old combined) will be considerably

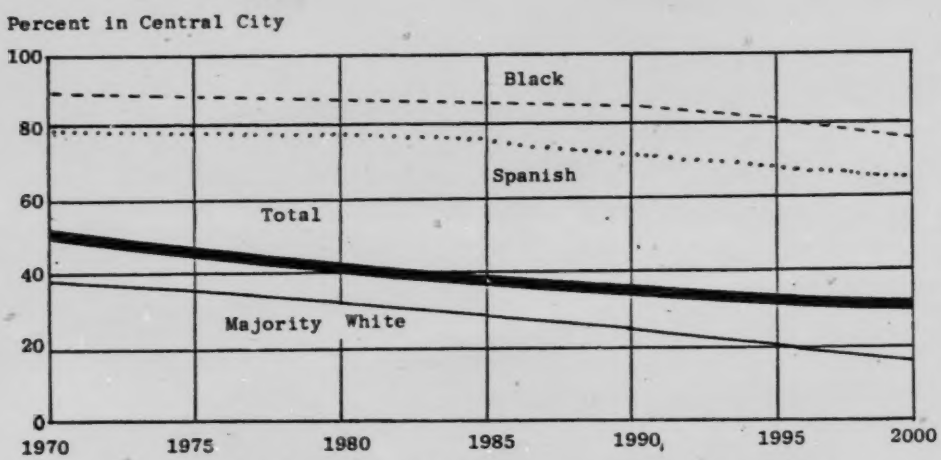

Figure 4. PERCENT OF SMSA POPULATION IN CENTRAL CITY, FOR EACH RACE/ETHNIC GROUP, 1970-2000

less throughout the remainder of this century than it has been during the past three decades. Meanwhile, the proportion of young adults (15-24 years of age) will decrease sharply, as the smaller generations of youngsters born during recent years pass into early adulthood. Thus, the recent and current youthful composition of the population will gradually move to a more "forty-fivish" composition by 2000. (The "old age" phase will not emerge as a major economic and social phenomenon until about the year 2020.)

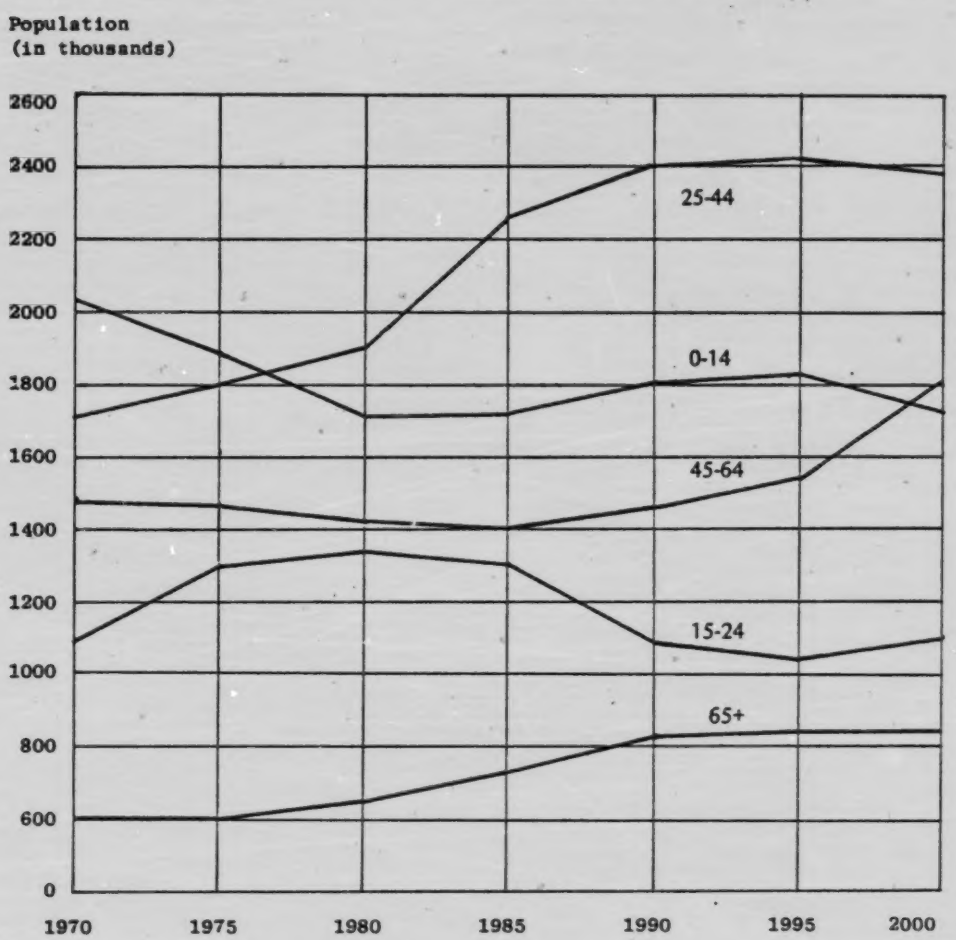

Figure 5. POPULATION OF THE CHICAGO SMSA BY AGE, 1970-2000

For Chicago city, the combination of age shifting and migration losses should result in considerable decline in persons under 24 years of age and 45-64 years old until 1990. For the suburban ring, there should be impressive increases in persons 15-24 years old during the remainder of the 1970's and in persons over 25 years of age throughout the period.

As the following discussion of number of households, labor force participation, and school enrollment will illustrate, the overall effect of these age changes will be to place less strain on the community to assimilate large numbers of additional population each year, while gradually augmenting the number of elderly dependents.

E. Number of households: SMSA, city and suburbs

The number of households in the SMSA will increase moderately rapidly for the remainder of the century, which will give the home-building industry a steadily expanding market. This greater-than-population growth is a result of rising numbers of female-headed households, the smaller size of households, and the aging of the baby-boom generation into the home-buying stage. Meanwhile, the Black and Spanish-speaking population, traditionally clustered in large households, are expected to move toward the smaller size households more typical of the population at large.

Changing numbers of households have important consequences for economic growth because so many goods and services are consumed by household units (from automobiles and major appliances to telephones and newspaper subscriptions). Under the projection assumptions, the number of households in the metropolitan area would increase 39.7 percent during the period (2,183,600 in 1970 to 3,050,500 in 2000), while the total population would increase only 14.3 percent. Most of the increase would be among households headed by persons under the age of 45 (until 1990). The number of households headed by females would increase about twice as fast as households headed by males, even though throughout the period more than 75 percent of households would be headed by males.

A total of 680,000 additional households (roughly equivalent to dwelling units) will be required to house the population between 1978 and 2000, or an average of about 31,000 per year. All but about 50,000 of this additional growth is predicted to take place in the suburbs. Despite a substantial decline in households in 1970-78 and the predicted slow decline in population in 1978-2000, the city is expected to gain about 2,000 households each year (1978-2000) due to smaller population per household and changes in age composition.

The race/ethnicity composition of households will gradually change to reflect the changing composition of the population, described above. However, the proportion of White households will be larger than the proportion of the White population because of the expected (though diminished) continuation in the differentially smaller White household.

The proportion of households headed by females will remain at about the same level as at present (24 percent). The present high rate for Chicago city (31 percent) is expected to continue, while the lower rate for the suburbs (17 percent) will rise somewhat (to 20 percent) due primarily to older age composition and changing race/ethnicity composition.

F. Marital status: SMSA, city and suburbs

Being single (unmarried) has been a major feature of the social scene for the past decade. This is destined to undergo substantial change in coming years, for the percentage of the population classed as single will decline from its current level of 26.4 to 20.2 (a decline of almost one-third in the proportion). Meanwhile, the proportion that is married and living with spouse will jump from 59 to 64 percent. Thus, the much-predicted demise of the family system is not expected to materialize. Current high divorce rates may continue, but the tendency to remarry after divorce will result in only a small increase in the divorced-widowed group, which will remain nearly constant at its present level of 15 percent.

The percent married with spouse present is now considerably lower in Chicago city (54 percent) than in the suburbs (63 percent). The rise in the proportion married will be about equal in both places, so that in the year 2000 about 58 percent of the population in the city 15 years and older will be in the married state; in the suburbs the proportion will be 68 percent. Thus, a progressive increase in familism may be expected throughout the metropolitan area. This change will be due, of course, to the low fertility of the past 15 years, which brought smaller cohorts of people to the state of young bachelorhood.

G. Labor force

The labor force in the SMSA is expected to grow at an average of about 25,000 persons per year. This calls for a faster rate of growth than the expected rate of population growth (24.4 vs. 14.3 percent). This development may signal a rapid rise in level of living and a diminution of poverty, because of the greatly decreased "dependency load" which workers must carry. Whereas in 1970 there were 1.26 dependents (persons not in the labor force) for each worker, in the year 2000 this ratio will decline to only 1.07. If wages keep up with inflation and unemployment does not worsen, the greatly reduced dependency ratio should cause a per-capita rise in income of more than 20 percent—due solely to demographic factors.

Three demographic forces will influence the size of the labor force:

(a) Lowered fertility in the 1960's and 1970's will cause smaller numbers of young persons to enter the work force in the 1980's and 1990's. The annual flood of high school and college graduates seeking work began to diminish markedly in 1978, and will become progressively smaller each year. This should contribute substantially to a lowering of the rate of unemployment, which tends to be highest among young persons.

(b) Meanwhile, the continuing tendency for a larger percent of females to join the labor force will tend to offset the decreased pressure for employment caused by low fertility. The aging of the baby-boom generation into the prime working ages (both male and female) will tend to promote labor force growth.

(c) Whereas the labor force in recent years has been flooded with large numbers of young and inexperienced workers, the labor force will gradually be comprised predominantly of experienced workers in their prime working years. This change in age-composition may result in higher per-worker productivity and higher per-worker income. The net effect of the demographic factors will be to cause labor force growth of a type leading to economic well-being and prosperity. With an increase in the proportion of the population married and with greater employment of women, there should be a very substantial rise in income per family. With the continued low levels of fertility projected, the typical household economy should be one of comfortable living, if not affluence. Poverty may be expected to shrink substantially as a result of demographic change alone, if not from other factors.

All of the projected increase in the labor force will take place in the suburbs; Chicago city's labor force will decline slightly, losing only about 7,000 in the 22-year period.

One possible problem of the labor force will be lack of opportunity for the baby-boom generation babies to get promoted.

During the 1980's, persons in the labor force aged 25-44 would increase 27.6 percent (adding 408,300 persons), while most of the other age groups would decline. All of the total labor force growth would be accounted for by the increasing numbers of these young adults. It has been suggested that these events imply life-long frustration for the baby-boom generation in attempting to satisfy career and income objectives (*Business Week*, February 20, 1978). In the late 1980's and early 1990's, middle-age workers are likely to face intense competition for the relatively few positions high on their career ladders, even while there are declining numbers of new labor force entrants at younger ages to take the lower positions. More than other generations, it may be prudent for the baby-boom people to cultivate interests and investment in activities outside of work.

The number of workers over age 65 will decline to 1990, despite population growth in these ages, because of the assumption of continuing declines in the labor force participation ratios of these ages.

Under the projection assumptions, the female labor force would increase about three times as fast as the male labor force until 1990. In 1970, women comprised 37.8 percent of the metropolitan area labor force but would comprise 42.2 percent as early as

1990. These changes would result from the increasing participation of women in the labor force (especially in ages 20-44).

The race composition of the labor force will undergo substantial change:

Race/ethnicity	*1970*	*1978*	*2000*	*Change*
Total	100.0	100.0	100.0	--
Black	15.2	17.2	21.0	+5.8
Spanish	3.9	5.9	10.7	+4.8
Majority White	80.9	76.9	68.2	-12.7

The decrease in the Majority White labor force will be offset about equally by increases in the proportion of Spanish and Black workers.

It must be emphasized that this projection of the labor force is *demographic*, and portrays only the *supply* side of the equation. These projections assume that the Chicago economy will be sufficiently active to be able to employ (and have a demand for) the persons who will be available for work.

H. School enrollment

School officials have much to gain from population projections, because at the elementary school (and to a great extent at the high school) level, enrollment is almost completely a result of recent fertility levels and migration. Because birth rates have been falling steadily since 1957, elementary school enrollments have been dropping equally steadily (see Tables 1, 2, 3 and Figure 6). Out-migration from the City of Chicago to the suburbs have tended to accelerate this decline in the city and to make it more gradual in the suburbs. Because fertility rates have continued to decline during the past five years (they may be levelling off in 1978), the elementary schools can look forward to further declines until at least 1983. The projections assume that the steady declines in the birth rates of the Majority White populace will partially reverse themselves and climb back toward replacement level by the year 2000, while the rapid drop in the Black population's birth rate will continue to replacement level. This would result in a mild increase in births beginning in the 1980's, and is reflected in the forecast that elementary school enrollment will begin to rise in the late 1980's and will continue to rise until 2000. (Because of out-migration and its race/ethnic composition, Chicago will experience this possible development only mildly between 1985-1990.) It would have a substantial effect upon increased elementary school enrollments in the suburbs after 1985, and could cause them to rise as high as in 1970, or even higher. Whether or not this will happens depends upon the fertility of the Majority White population during the coming decade. If recent low birth rates among Majority Whites continue, the forecasted recovery of elementary school enrollment will of course not take place.

Enrollment trends in high school tend to follow those of the elementary school with a lag of about 5-6 years, as the generations of students get older. Consequently, the smaller generations of youngsters which now are passing through elementary school will be entering high school and causing a steady decline in high school enrollment until at least 1990. (See Tables 1, 2, 3 and Figure 7.) Because of heavy out-migration this decline has already been underway in Chicago for a few years. This same migration has tended to mask the onset of this effect in the suburbs, but from 1978 onwards, enrollment in suburban high schools will also decline until about 1990. (See Tables 1, 2, 3 and Figure 7.) Thereafter, the birth rate recovery described above could lead to increased high school enrollment in the last five years of the century.

The detailed tabulations reported in Part II of this report provide estimates of the enrollment that can be expected in each single grade of elementary and high school in

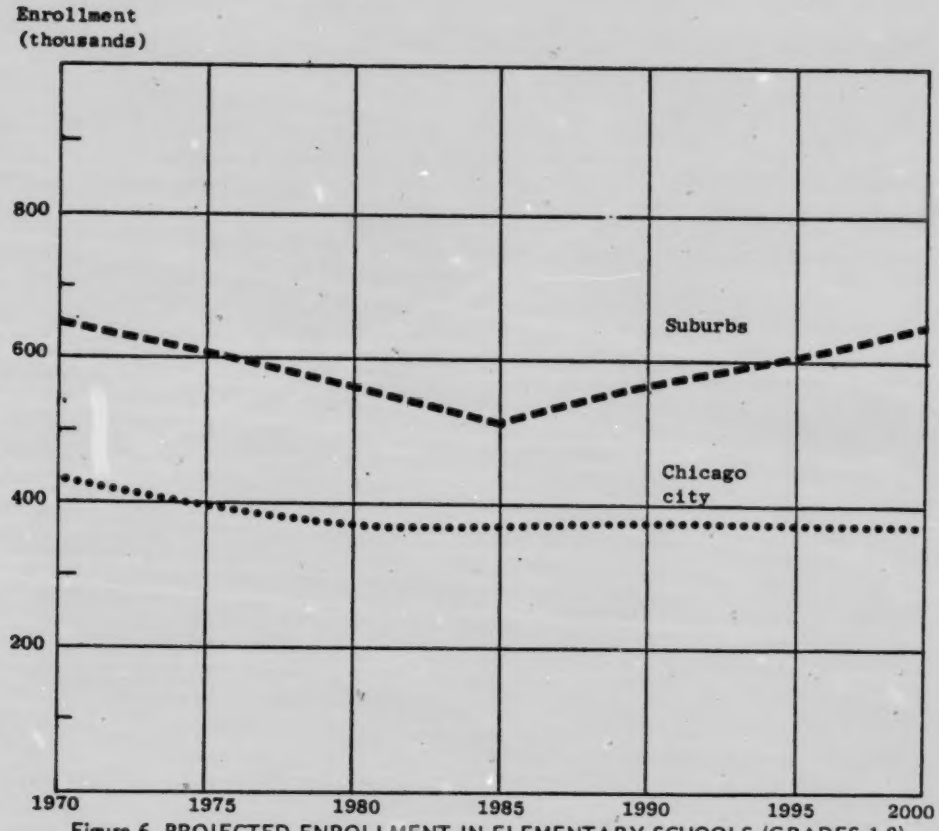

Figure 6. PROJECTED ENROLLMENT IN ELEMENTARY SCHOOLS (GRADES 1-8) IN CHICAGO CITY AND SUBURBS, 1970-2000

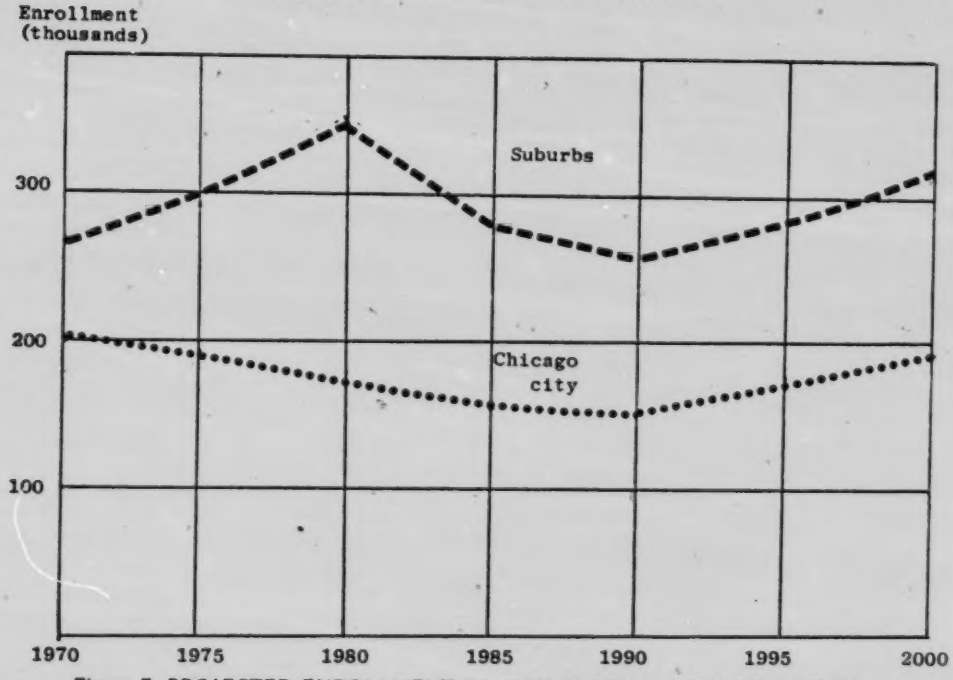

Figure 7. PROJECTED ENROLLMENT IN HIGH SCHOOLS (GRADES 9-12) IN CHICAGO CITY AND SUBURBS: 1970-2000

future years. These are reported by the race/ethnic origin of the students, on the assumption that students will enroll in Chicago schools if they reside in Chicago, and likewise for the suburbs. Because of the possible utility this information may have, it is tabulated for each single year from 1978 to 1986, as well as for five-year intervals from 1975-2000.

The changing race/ethnic composition of the general population is reflected in the race/ethnic composition of school enrollments, but with a difference. The changing birth rates of these race/ethnic groups have a more immediate effect upon school population than upon the total population count. Because the birth rates of the Black population have been declining rapidly in recent years, coupled with net out-migration, the projections indicate a surprising development: the percentage of the elementary school enrollment which is of Black ethnicity reached a peak about 1978, and may be expected to decline somewhat in future years, to be slightly more than one-half of all enrollment for the remainder of this century. (A huge increase in the proportion of Black students occurred between 1970 and 1978.) Meanwhile, the proportion of elementary students that is Spanish-speaking will continue to increase. The projections, which call for a slackening of the "White flight," show a slight increase in the proportion of Majority White population in the City's elementary schools. The following table summarizes the expected changes:

Area and Race/Ethnicity	1970	1978	1985	Change
Chicago City	100.0	100.0	100.0	--
Black.....	45.4	54.6	51.1	+5.7
Spanish.....	10.0	17.5	19.1	+9.1
Majority White.....	44.6	27.9	29.8	-14.8
Suburban Ring.....	100.0	100.0	100.0	--
Black.....	4.1	5.7	8.4	+4.3
Spanish.....	2.8	4.5	6.2	+3.4
Majority White.....	93.1	89.8	85.4	-7.7

This tabulation indicates that demographic forces will bring about a modest increase of Black and Spanish students in suburban areas and the emergence of a comparatively stable tri-ethnic situation in Chicago city in which the mixture of students will be about 50 percent Black, 20 percent Spanish, and 30 percent Majority White. Contrary to the claims of some, these data suggest that there will be a sufficient supply of Spanish and Majority White students in the City of Chicago to permit substantial school integration. If these assumptions about the slackening of migration of Whites to the suburbs are wrong, the City's schools will become progressively dominated by enrollment from Black and Spanish families.

The expected race/ethnic composition of high schools in Chicago city and suburban ring is similar to that for the elementary schools with a time lag. Projections also call for increased completion of high school by Black and Spanish youths, many of whom have in the past left school between the 8th and 10th grades. The projected changes in ethnic composition of high schools in Chicago city and the suburban ring are as follows:

Area and Race/Ethnicity	1970	1978	1985	Change
Chicago City.....	100.0	100.0	100.0	--
Black.....	39.4	55.9	58.5	+19.1
Spanish.....	7.1	13.7	20.5	+13.4
Majority White.....	53.5	30.4	21.0	-32.5
Suburban Ring.....	100.0	100.0	100.0	--
Black.....	3.4	4.8	7.2	+3.8
Spanish.....	1.8	3.1	5.0	+3.2
Majority White.....	94.8	92.1	87.8	-7.0

Neglected in the above discussion is the phenomenal increase in nursery school and kindergarten enrollment that may be expected both in Chicago city and the suburbs until at least 1985-1990. The movement to enroll children before they enter first grade is no longer a middle-class practice. It has come to be regarded as good for the development of the child and convenient for working mothers.

I. Classroom teachers

Much discussion about the number of classroom teachers that will be required to teach in the elementary and high school grades has taken place. These projections attempt to provide some solid evidence on this topic. Although the data are not summarized in Tables 1, 2, and 3, full details are provided in Tables 11 and 20 in Part II. Applying ratios of teachers-to-pupils used for making national estimates of teacher requirements to the Chicago situation, the number of classroom teachers that will be needed in future years can be estimated. Although the numbers may not coincide exactly with those of actual employment (because of differences between actual classroom size and the ratios used in the projections), the *trends* and percent changes from year to year are presumably valid and useful, at least until 1985 or 1990. Following is a summary of the tabulations:

Year	Elementary School		High School	
	Chicago City	Suburban Ring	Chicago City	Suburban Ring
1970...	20,604	26,276	10,662	13,583
1975...	19,794	29,141	10,913	17,572
1978...	18,626	28,311	10,584	18,667
1979...	18,419	27,882	10,459	18,780
1980...	18,335	27,455	10,346	18,777
1981...	18,302	26,998	10,227	18,637
1982...	18,345	26,642	10,110	18,406
1983...	18,459	26,403	10,007	18,103
1984...	--	26,333	--	17,751
1985...	18,898	26,447	9,877	17,375
1990...	19,612	28,405	9,540	15,219
1995...	19,714	32,649	10,179	15,724
2000...	18,258	34,746	10,774	18,206

This tabulation shows an almost unchanged demand for elementary school teachers in Chicago city at the level of 18,400 for the entire five-year period 1978-1983. The projected recovery of the birth rate of the Majority White population and the slackening off

of their out-migration calls for a slight increase in enrollment thereafter; this may or may not materialize.

The projections also call for a steady decline in the demand for high school teachers in Chicago city from the present until 1990. The amount of decline is about 9 percent over the 12-year period, or roughly 0.75 percent per year. This is a reduction of about 1,045 teachers, or about 870 per year. Thereafter, projections call for the start of the same revovery predicted to begin in the elementary schools about 1985.

In the suburbs, a decline in demand for elementary teachers, which began about 1975, is projected to continue steadily until 1984. This calls for an overall decrease of about 7 percent (2,000 teachers) in the six-year period, or about 1 percent per year. Thereafter, the expected rise in fertility rates is expected to cause a recovery in the demand for elementary teachers.

Suburban high schools as a whole are projected to require a few more teachers in 1979 and 1980 than in 1978, and then to begin to suffer a decline until 1995. When it sets in, this decline will be sharp. It calls for a loss of 3,500 positions (nearly 20 percent) in a period of 15 years. The recovery projected for the year 2000 will depend upon the trend in fertility between 1978 and 1985.

Unfortunately, these overall trends cannot be used to predict the future needs of individual school districts, because of differences in age composition and current trends of in-migration or out-migration. Projections for individual school districts are possible, but somewhat laborious.

J. College enrollment

Because the last of the baby boom generation began entering college in 1977, and because college-attendance rates have been rising (particularly for minority persons and women), a modest increase in college enrollment may be expected for a few additional years. The tendency toward continued study in graduate school causes graduate school enrollment to remain high. But ultimately, the very substantial impact of the low birth rate generations (1958 and following) will have a drastic effect upon college enrollments, as the following summary shows:

Year	Elementary School		High School	
	Chicago City	Suburban Ring	Chicago City	Suburban Ring
1970...	78,225	87,270	16,458	20,017
1975...	94,779	135,836	19,852	26,968
1978...	102,772	169,004	21,363	33,135
1979...	105,169	179,605	21,795	35,449
1980...	107,449	189,630	22,204	37,856
1981...	109,584	198,865	22,593	40,299
1982...	111,528	207,151	22,949	42,748
1983...	113,269	214,360	23,280	45,157
1985...	116,357	225,194	23,942	49,625
1990...	106,137	206,350	22,464	51,501
1995...	103,695	186,999	21,903	47,792
2000...	109,786	189,662	22,984	43,868

From 1965 to 1977, the baby boom generation entered college as freshmen. College enrollments shot up spectacularly; the period 1970-75 was a time of particularly rapid growth. Meanwhile, college-attendance rates have been rising, particularly for minority freshmen, so that the expansion due to fertility has nearly ended for undergraduate levels, and future expansion will be due only to increased attendance rates. The expansion

due to increased attendance rates is expected to bring about a small continued growth until about 1985. At about this time the depressive effects of the low birth rate years and the levelling off of enrollment rates will bring about a comparatively sharp and sudden decline in undergraduate enrollment.

Graduate schools can expect to benefit from the baby boom for a few more years. Also, the tendency for graduate school enrollment rates to keep on rising, rather than levelling off, is projected for a longer span of time. Consequently, graduate school enrollment will continue to rise moderately rapidly until at least 1990. At that time the low fertility phenomenon begins to take over and cause a decline.

The projections show separate tabulations for Chicago city and suburbs. This refers to the *residences* from which the students will be drawn, and not to the schools they will attend. Many students leave the Chicago area entirely to attend college, and the Chicago area receives many students from outside. These statistics reflect the changing *demand* for college education that will be generated by the local residents. Because the effect of the passing of the baby boom generations and their replacement by low-fertility cohorts is nationwide, the statistics can be accepted as a good general guide for the pattern of future enrollment trends. Clearly, the wave of expansive growth has ended and will not reappear in this century. A plateau of enrollment at slightly higher levels than at present will last for a decade and then be followed by a sharp slump.

The detailed tabulations, provided in Part II, subdivide the college enrollment statistics into individual years by sex and race/ethnicity of the students. Careful study of these data will show impressive increases in the enrollment of minority populations (especially Spanish-speaking) and of women.

III
General Assumptions

All population-related forecasts are judgemental, based as they are on assumptions about trends in births, deaths, migration, and social participation. The assumptions on which these forecasts rely are summarized and discussed below.

Population projection assumptions are that mortality rates for Majority Whites will remain at the level of United States Whites in 1970 (specific for age and sex), that Black mortality will move from United States Black levels in 1970 to match White rates in 2000, and that Spanish mortality rates are the same as those of other Whites. Fertility rates were computed on an age specific basis by race for the metropolitan area in 1970, except that Spanish rates were computed from data for the nation. It is assumed that fertility rates for the Black and Spanish populations will fall to replacement level at 2000 and that other White rates will rise to 90 percent of replacement at 2000. Migration assumptions for the city are that the net migration gains of Spanish people and losses of Blacks will continue and that the heavy losses of Majority Whites will diminish by 1980, reaching zero at 2000. It is assumed the suburban ring will experience net migration gains for all of these groups.

Household assumptions are that marital status patterns (the proportion of each age-sex-race group who are single, married spouse present [including common-law] or other ever-married) will move from 1970 local levels to match the projected national pattern in 1990. Chiefly, this means later age at first marriage, larger proportion of divorced persons in the middle adult years, more remarriage, and less widowhood in later life. Also, it is assumed that the household formation pattern (the proportion of each age-sex-race-marital status group who are heads of households) will move from 1970 local levels to match the projected national pattern at 1990. Chiefly, this means an increasing tendency to form separate households, especially for women (but not among married men with spouse present).

The labor force forecasts also rely on assumptions in addition to the population assumptions. It is assumed that labor force participation rates for each age, sex, and race group will move from local 1970 levels to match projected national levels in 1990. This implies slight declines in labor force participation for men at most ages and sharp increases for women at most ages under 55 years.

For the school enrollment projections, there are additional assumptions beyond the population assumptions. It is assumed that the proportion enrolled in school of each age, sex, and race group (the school enrollment ratio) will rise from the local 1970 levels to match the projected national levels at 1985. Essentially this means rising enrollment ratios for 3 to 5 year old children and for women and minorities in their late teen and early adult ages. Projections of teacher requirements assume the historical and projected *national* teacher/pupil ratios at each date (simply to show the impact of changing enrollments) so they do not use local teacher/pupil ratios.

The assumptions about future trends in deaths, births, and migration are based partly on continuation of trends and partly on changes in these trends. The *safest* assumption is that current trends will continue as they have in the recent past. But the *best* assumption is that current trends will change. The direction and rapidity of change in trends then must be anticipated. Some forecasters allow a degree of latitude in their projections by specifying two or three levels of fertility rates in estimating future national population. Similar alternative estimates for migration for local areas would result in a matrix of four to nine different forecasts. This study opts for the single most likely trend and the single-point forecast, realizing the greater risk of error entailed by this level of precision.

What are the strengths and weaknesses of these projections? What is the justification for the assumptions of change in trends? What assumptions are made about public policy decisions in Chicago and Washington, or about national economic forces that may affect births and migration?

By far the most reliable part of the projections is the one attributed to the aging of the present population. More problematical are the rates of migration, fertility, family formation, school enrollment, and labor force participation of the already present population. Most of the substantial changes that were forecast for age and racial composition and for labor force and school enrollment flow out of the dynamics of this already present population.

Many people may realistically find these fertility assumptions to be too conservative, and the migration assumptions to be too optimistic. (However, if this were so, the opposite directions of these two biases would tend to cancel each other.) Fertility rates are subject to considerable fluctuations, for which even the benefit of hindsight does not always provide more than speculative explanation. Intrametropolitan and intermetropolitan migration trends also are subject to fluctuation. What appeared to be an inexorable exodus of the middle class from the central city to the suburbs may show signs of abating because of the energy crisis and the revitalization of central city neighborhoods.

The year 1970 marks a major turning point in the growth of metropolitan areas. Until then, these areas were growing faster than the nation through net in-migrtaion. But since 1970, these areas are growing more slowly than the nation because of net out-migration. Is this turnaround the result of a disruptive event like the 1974-75 recession or the result of long-term secular economic forces? Part of the success of the "return to the city" movement is attributed to the dynamism of municipal and corporate leaders and policies. Part of the shift of people and jobs from the Snow Belt to the Sun Belt is ascribed to deliberate efforts of public investments by the military establishment. How effective are these political interventions in the market place of locational decisions by households and industry?

Space does not permit discussion of these and other variables that impinge on trends of births, deaths, and migration. Let it suffice to say that the art of the demographer is to make judgements that distill these complex phenomena into single trends of population

change. Nor does space permit the full implications of these projected trends for planning by government, industry, and households. These projections, it should be noted, develop only the demand side of the institutional needs. Whether these projected workers, consumers, students, and taxpayers entail a looser or a tighter job market, housing market, education market, or public service market depends in large part on the response made by industry and government to these population changes.

Moderate optimism best characterizes these population projections for Chicago and its metropolitan area. Heavy migration losses experienced by both areas in the 1970's are predicted to abate significantly by the end of the decade. Within the metropolitan area, Chicago will become a more viable albeit transformed entity, and within the nation, the metropolitan area will continue to be a vigorous though aging competitor for the location of households and jobs.

APPENDIX: METHODS AND ASSUMPTIONS

This appendix describes the step-by-step procedures used to make detailed forecasts of the metropolitan population, households and families, labor force, and school enrollment.

I
Metropolitan Population Projection

We present here our step-by-step procedure, which employed the POPROJ computer program (Donald Bogue and Louise Rehling, RFFPI Manual 12, CFSC, University of Chicago). The procedure produces age-sex-race specific population projections. The procedure is based on a set of national parameter forecasts which are adjusted to local conditions. The general forecast method is the cohort-component method; therefore, our outline specifies information about the base population and the assumptions regarding mortality, fertility, and net migration.

A. Base population, by age-sex-race. 1970 population by age-sex-race is given in *1970 Census of Population*, Illinois volume, Tables 24 and 96. The proportion of the total Spanish language population that was White was estimated using the ratio White Spanish mother tongue/total Spanish mother tongue, from Table 142. The residual or "other" population group was calculated as (total-Black-White Spanish Language).

Here the strategy was to adjust the base population's age distribution for differential net undercount. Otherwise, errors in the age distribution of the base population would be carried forward in the projections. The procedure was to adjust for net undercount using national net undercount estimates from *1970 Census of Population and Housing*, PHC (E)-4, Tables 4 and 5. Thereafter, the entire age distribution for each race-sex group was raked to equal the total from the 1970 Census.

B. Mortality assumptions. 1970 L_x values were assumed constant to the year 2000 (except Black 1970 L_x goes to the White L_x at 2000). White L_x values were applied to the Spanish population. Life Table data were taken from Vital Statistics of the U.S., mortality statistics. United States L_x values were used.

C. Fertility assumptions. 1970 race and age specific fertility rates were computed from the birth data given in *Vital Statistics of the United States, 1970* and published population data from above. These were local rates, except that Spanish heritage urban

fertility rates were computed from national data using the own-children method (Bogue, *Demographic Techniques of Fertility Analysis*, Chicago, CFSC, 1971, page 72).

For the 1975 and 1980 assumptions, national projected age-specific fertility rates were utilized, as given in Series II in *Current Population Reports*, P-25, number 704, Tables A-6 and A-7. The ratio (projected U.S. TFR/1970 U.S. TFR) was applied to the local 1970 ASFR (the ratio for Whites was applied to the Spanish 1970 ASFR and only for the year 1975). Finally, 1970 and 1975 rates were adjusted to give results consistent with published birth data for the area through those dates.

For the year 2000 assumptions, it was assumed that Black and Spanish fertility would be at replacement level (U.S. series II, the Spanish at White replacement level) and that other White fertility would be at 90 percent of replacement.

D. Net Migration assumptions. These assumptions were based on recent trends, the latest available data, and the authors' judgements about future net migration. This information is presented in Appendix Table 1.

The age-sex distributions of net migration were obtained as follows. Black net migration at the city was distributed by age and sex like 1965-70 Black migration from the North Central to the South and West regions. Spanish net migration wss distributed by age and sex like 1965-70 Spanish Origin net migration at the North Central region. All other net migration totals took the age-sex distributions of the 1960-70 local estimates for that race group.

E. Matching most recent estimates. Before projecting population to future dates, care was taken to force the input data to reproduce the most recent and reliable estimates of local area population (1975). Such estimates are published in *Current Population Reports*, Series P-25, Number 661.

Appendix Table 1. AVERAGE ANNUAL AMOUNT OF NET MIGRATION, CHICAGO CITY, RING, AND SMSA: ESTIMATED 1960-1975, AND ASSUMED 1975-2000

Area and Race	Estimated		Assumed [a]	
	1960-1970	1970-1975	1980	2000
Chicago City				
Black	11,319	-7,635	-7,500	-10,000
Spanish	-53,267	6,314	5,000	0
Majority White	--	-81,177	-35,000	0
Chicago Suburban Ring				
Black	3,481	4,423	5,000	7,500
Spanish	54,257	4,440	5,000	5,000
Majority white		21,702	15,000	0
Chicago SMSA				
Black	14,800	-3,212	-2,500	-2,500
Spanish	990	10,754	10,000	5,000
Majority white	--	-59,475	-20,000	0

[a] The computer program POPROJ automatically calculated the annual amount of net migration for each year by interpolating linearly between the values for 1970, 1975, 1980, and 2000 as above.

Sources: 1960-1970, computed by the average census survival ratio method using data from the 1960 and 1970 Census of Population and national census survival ratios. 1970-1975, computed as the difference between the 1975 estimated population (Current Population Reports, P-25, no. 661 with race detail based on Current Housing Reports, Annual Housing Survey, 1975, Chicago) and the 1975 mortality trends and no net migration 1970-1975.

II
Metropolitan Functional Population Projections

A. Procedure for Computing
(a) Marital Status
(b) Households
(c) Families

Functional population projections demonstrate clearly the implications of anticipated population changes, by making forecasts of labor force, housing demands, etc. This section presents the step-by-step procedure used for forecasting household and family characteristics, using the FUNCPROJ computer program (by D.J. Bogue and Susan Biehler, CFSC, The University of Chicago). The projections are based on a set of national parameter forecasts, which are adjusted to local conditions. Sources for the national parameters are noted in Appendix Table 2.

Step 1. This step derived the noninstitutional population of the area, by applying to the projected population age-sex-race specific noninmate ratios (1-ratio of "inmates in institutions" to the population). For most areas it is desirable to remove the institutionalized population before calculating households. Inmate data for 1970 are given in *1970 Census of Population,* Illinois volume, Tables 154, 25, and 96. (Because of limited detail in the reported data, the number of inmates for each race/language group for each area was distributed over age and sex like the inmates of the SMSA, except that Black and Spanish women inmates were distributed over age like inmates in the State in 1970 for that race.) These noninmate ratios were set constant from 1970.

Step 2. This step distributed the noninstitutional population into marital status categories, on the basis of projected proportions in each marital status for each age-sex-race group.

(a) 1970 marital status distributions by age-sex-race are given in *1970 Census of Population,* Illinois volume, Table 152 for the SMSA. For Majority White, it was necessary to compute the marital distribution for the city and ring separately (using age-sex-race-marital status data for Whites from census tract tapes).

(b) Projected marital status distributions were obtained by assuming that local 1970 proportions move linearly to match projected national proportions at 1990 (constant to 2000). FUNCPROJ automatically interpolates between schedules entered for different dates. The Spanish distribution was assumed to be the same as Majority White by 1990. To preserve some of the ring-city difference in marital distributions, it was assumed for Spanish and Majority White that one-half of the 1970 ring-city difference remains at 1990, with one-quarter of the difference on each side of the national projections.

Step 3. This step derived the projected number of households by applying household headship ratios to projected population by marital status-age-sex-race. The procedure yields numbers of households classified by various characteristics of the head.

(a) Base year headship ratios for 1970 were calculated as (1) numbers of households by head's age-sex-race-marital status divided by (2) population by age-sex-race-marital status. (For the SMSA, data are given in *1970 Census of Population,* Illinois volume, Table 152 and 153. Marital status here included only married spouse present and "all others.") To generate sufficient detail for the city and ring separately, SMSA headship ratios were applied to the city and the ring populations by age-sex-race-marital status. The resulting distributions of household heads were forced to equal reported heads by race and sex for the city and the ring, and then headship ratios were recomputed.

(b) Projected headship ratios were obtained by assuming that local 1970 ratios move linearly to match projected national ratios at 1990 (constant to 2000), except Spanish

move to Majority White ratios at 2000. To preserve some of the ring-city differences in 1970 headship ratios for White females, it was assumed that one-half of the 1970 ring-city difference remains at 1990, with one-quarter of the difference on each side of the national projection. The number of persons per household was computed by dividing non-institutional population by the number of households.

Step 4. This last step divided households into family and nonfamily households. (Family households are households which include relatives of the head. Nonfamily households are headed by primary individuals and do not contain members related to the head. In this procedure, numbers of subfamilies are not computed.) The procedure was to apply the proportions family and nonfamily (which add to 1) to the projected numbers of households specified by the head's age-sex-race-marital status.

(a) 1970 household type. It should be noted that calculating these parameters reduced to calculating proportions in family and nonfamily households only among not married spouse present heads. (By definition all "married spouse present" households are headed by males and are families.) The necessary proportions could be calculated for the SMSA specific for head's age-sex-race (and marital status) from *1970 Census of Population*, Illinois volume, Table 153. (Among female-headed households not married spouse present, the proportion nonfamilies is primary individual heads divided by total households. Among male-headed households not married spouse present, the proportion nonfamilies is primary individual heads divided by total households-heads married spouse present.) To generate sufficient detail for the city and ring separately, the SMSA family proportions were applied to the city and ring heads computed above. The resulting age distribution of family heads by sex-race-marital status was forced to equal the number of families by heads' sex and race for the city and the ring as reported in Table 25 of Volume II. Then the proportion family households was recomputed.

(b) Projected proportion family households was obtained by assuming that local 1970 proportions move linearly to match projected national proportions at 1990 (constant to 2000), except that Spanish move to Majority White proportions at 2000.

B. Procedure for Computing Labor Force

Presented below is the one-step procedure used for forecasting local area labor force. Sources for national parameters are listed in Appendix Table 2.

Step 1. This single step derived the projected labor force by applying to the projected population age-sex-race specific labor force participation ratios (the ratio of the labor force to the population).

(a) Local area labor force participation ratios in the base year (1970) are reported in the *1970 Census of Population*, Illinois volume, Tables 85, 92, and 98. It was necessary to adjust the participation ratios for presumed errors in the census data. For the nation in 1970, labor force participation ratios from the census differed from the ratios reported in the Current Population Survey. Because the CPS data refer to average annual participation (rather than April), represent more accurate data, and served as the basis for projected national parameters, it was necessary to adjust 1970 local ratios for the national CPS-census differences (by simply adding that difference to local census ratios).

(b) Projected labor force participation ratios were obtained by assuming that local 1970 ratios move linearly to match projected national ratios at 1990 (constant to 2000), except Spanish goes to Majority White ratios at 2000. To preserve some of the ring-city differences in labor force participation ratios for Spanish and Majority White groups, it was assumed that one-half of the 1970 ring-city difference remains at 1990, with one-quarter of the difference on each side of the national projection.

C. Procedure for Computing

(a) School Enrollment by Race, Age, and Grade

(b) Public and Nonpublic Enrollment

(c) Teacher Requirements

Presented below is the step-by-step procedure used for forecasting school enrollment characteristics, using the FUNCPROJ computer program. Again, the general strategy was to adjust a set of national parameters to local conditions. Sources for national parameters are listed in Appendix Table 2.

Step 1. This step derived projected school enrollment by age-sex-race by applying enrollment ratios to the population projections.

(a) Local base year (1970) school enrollment ratios were computed from data available in the *1970 Census of Population*, Illinois volume, Tables 146 and 215. It was necessary to adjust these enrollment ratios for presumed errors in the census in the same manner as were the labor force participation ratios.

(b) Projected school enrollment ratios were obtained by assuming that local 1970 ratios move linearly to match projected national ratios at 1985 (constant to 2000).

Step 2. This step distributed students at each age over grade in which enrolled.

(a) For the base year (1970), one local set of matrices of enrollment for age by grade (a matrix for each race-sex group) was used, computed for the SMSA from *1970 Census of population*, Illinois volume, Table 146.

(b) For the nation in the 1970's, there has been a trend for college age students to stay in school at later ages and achieve higher levels of schooling. Chicago Majority Whites in 1970 had the national 1977 age by grade pattern. Therefore, the projected local age by grade assumptions were that Majority Whites could follow their 1970 pattern to 2000 and that Black and Spanish students' patterns would move linearly to match the White pattern at 2000.

Step 3. This step divided enrollment at each projection year into public and nonpublic enrollment.

(a) For 1970, the proportion public was obtained by race and grade level for the city and the ring, from the census table mentioned above.

(b) For succeeding years the difference between the U.S. 1970 proportion public and U.S. projected proportion public was added to the local 1970 proportion public. This assumed the same *kinds* of change locally as nationally in public-nonpublic division, but did not assume convergence to the national form. Chiefly this implies stability in the race-grade specific pattern for the city and the ring, except for increases in the proportion of college students in public institutions.

Step 4. This step indicates implied teacher requirements. The national 1970 and projected teacher/pupil ratios were applied to local projected enrollments. Interpret the results in these terms: teacher requirements implied in projected local enrollment and *national* teacher/pupil ratios (using national and not local standards).

Appendix Table 2. SOURCES FOR NATIONAL PARAMETERS

A. Population Projections.
Fertility assumptions; Current Population Reports, P-25, number 704, Tables A-6 and A-7.

B. Functional Projections.
(1) Household and Family Projections (available only to 1990).
Marital status distribution: Current Population Reports, P-25, number 607, Table 4. Race detail was not reported but was obtained by assuming the U.S. 1975 white-black difference reduced by half by 2000 and white proportions change after 1975 in the same manner as the reported projections.
Headship ratios: Current Population Reports, P-25, number 607, Tables 2 and 4 (Series B). Race detail obtained as above.
Household type (family status): Current Population Reports, P-25, number 607, Table 2. Race detail obtained as above.

(2) Labor Force Projections (available only to 1990).
Bureau of Labor Statistics, Special Labor Force Report, number 197 (with color distribution from Special Labor Report, number 119) as given in Employment and Training Report of the President, 1978, Tables E-2 and E-4.

(3) School Enrollment Projections (available only to 1985).
School enrollment ratios: Assumed enrollment ratios are consistent with projected national enrollment from National Center for Educational Statistics, Projections of Educational Statistics to 1985-1986, Tables 2, 3, and 6. Ratios for ages 3-6 were computed by formulae in Table A-1, ratios for ages 7-13 were assumed at a maximum level of .996, and ratios for ages 14-34 were 1985 projected enrollment ratios from Current Population Reports, P-25, number 473, inflated to yield required total enrollment (given other enrollment ratios as above).
Proportion in public schools; National Center for Educational Statistics, Projections of Educational Statistics to 1985-86, Table 2.
Teacher-pupil ratios; National Center for Educational Statistics, Projections of Educational Statistics to 1985-86, Table 23.

Part II
DETAILED TABULATIONS

This section of the report consists of detailed cross-tabulations of the projections, without explanatory analysis. They are intended for study by individual researchers who wish to explore particular problems further. For some topics (especially labor force and school enrollment), these detailed statistics are provided for single years of age between 1978 and 1983, in order to show year-to-year changes in the years immediately ahead.

The projections are made separately for Chicago city and the suburban ring. As a result, there are two sets of parallel tables, the subject matter of which is as follows:

Subject	*Table number*	
	Chicago city	*Suburban ring*
Population, by age, sex, race/ethnicity	4	13
Households, by age, race/ethnicity, and sex of head	5	14
Households, by age, sex, and marital status of head	6	15
Marital status, by age, race, and sex	7	16
Families, by age, race/ethnicity, and sex of head	8	17
Labor force, by age, race, and sex	9	18
School enrollment by race/ethnicity, sex, and grade	10	19
Classroom teachers, by grade and institutional control	11	20
College enrollment, by level, race/ethnicity, and sex	12	21

These tables consist of numbers of persons, as printed by the computer. Although they report data to the unit of persons, they should be rounded to hundreds of persons in interpretation.

Unfortunately, a computer program which sums two or more sets of projections to arrive at a single total for both is not yet finished, and it was not possible to print a set of these detailed projections for the SMSA as a whole. (The summaries reported in Table 1 were derived by manual addition.) Users who wish to obtain SMSA totals not

already provided by Table 1 may obtain them by summing the respective items for Chicago city and the suburban ring.

The definitions of each of these topics are those of the U.S. Bureau of the Census.

In these tabulations, each panel of a table refers to a particular year. In order to study trends, it is necessary to trace a given item or set of items through all of the panels.

Users who wish to obtain more details about the projection methodology may wish to order, from the Community and Family Study Center, a manual *Functional Population Projections*, which is published in our Demographic Methodology series.
